NB Population Genomic Analysis on Non-Haplotig Masked Neutral SNPs

Amy Zyck

5/27/2020

Population analyses on Neutral SNP dataset

I first created a new directory `NB_PopGen_Neutral` within `PATH: /home/azyck/NB_capture/NB_ddocent`. I linked `neutralloci.recode.vcf` to this working directory. The RMarkdown file should be saved in this same working directory.

All Neutral SNPs

Making files

Make genind object

`neutralloci.recode.vcf` contains neutral SNPs for populations PVD, GB, BIS, and NAR. Steps for generating this VCF file are located in EecSeq_Cvirginica_dDocent.md and EecSeq_Cvirginica_Filtering.md. Population NIN was removed from the VCF file following steps in EecSeq_Cvirginica_OutlierDetection.md.

`strata` contains population, environmental, and library information for each sample - can be accessed here.

```
my_vcf <- read.vcfR("neutralloci.recode.vcf")
```

```

```

Repeat for quasi-independent set of SNPs

Steps for filtering are documented for OutFLANK in EecSeq_Cvirginica_OutlierDetection.md. However, I am repeating the steps here.

```
my_vcf <- read.vcfR("neutralloci.recode.vcf")
```

```
## Scanning file to determine attributes.

```

```r
geno <- extract.gt(my_vcf) # Character matrix containing the genotypes
position <- getPOS(my_vcf) # Positions in bp
chromosome <- getCHROM(my_vcf) # Chromosome information

G <- matrix(NA, nrow = nrow(geno), ncol = ncol(geno))

G[geno %in% c("0/0", "0|0")] <- 0
G[geno  %in% c("0/1", "1/0", "1|0", "0|1")] <- 1
G[geno %in% c("1/1", "1|1")] <- 2

# NA should be replaced with "9" to work with the functions in the OutFLANK package
G[is.na(G)] <- 9
```

Chromosomes need to be of class integer for this to work.

```r
# Visualizing chromosomes
chrom_unique <- unique(chromosome)
print(chrom_unique)
```

```
##  [1] "NC_035780.1" "NC_035781.1" "NC_035782.1" "NC_035783.1" "NC_035784.1"
##  [6] "NC_035785.1" "NC_035786.1" "NC_035787.1" "NC_035788.1" "NC_035789.1"
```

```r
# Removing "NC_" from the chromosome name so it can be converted to an integer
chrom_new <- chromosome%>%str_replace("NC_","")

# Converting the character string into an integer
chrom1 <- as.integer(chrom_new)
```

`chromosome` and `position` need to be sorted for imputation to work.

```r
chrom_sort <- sort(chrom1)
pos_sort <- sort(position)
```

Note: This filtering program does not allow for missing genotype values.

I can either remove the missing genotype values or impute missing genotypes. I'm going to try both and see how the two methods differ during the trimming step.

Remove missing genotypes

```r
# removing missing data
G_miss <- matrix(NA, nrow = nrow(geno), ncol = ncol(geno))

G_miss[geno %in% c("0/0", "0|0")] <- 0
G_miss[geno  %in% c("0/1", "1/0", "1|0", "0|1")] <- 1
G_miss[geno %in% c("1/1", "1|1")] <- 2

# removing missing data
G_miss[na.omit(G_miss)]
```

```

Using `snp_fastImputeSimple` to impute missing genotypes

This requires the genotpe matrix to be converted to class FBM.code256.

> A reference class for storing and accessing up to 256 arbitrary different values using a Filebacked Big Matrix of type unsigned char.

```r
# Converting the genotype matrix to class FBM.code256
G1 <- add_code256(big_copy(t(G),type="raw"),code=bigsnpr:::CODE_012)
```

The chunk below imputs missing genotypes in order for the following code to run. Fast imputation via mode, mean, sampling according to allele frequencies, or 0.

Method argument: Either "random" (sampling according to allele frequencies), "mean0" (rounded mean), "mean2" (rounded mean to 2 decimal places), "mode" (most frequent call).

Depending on the method I choose, the # of SNPs kept after running the following chunk changes, so I'm not sure which method to use.

```r
# Imputing missing genotypes
G_missSimple <- snp_fastImputeSimple(G1,method = "mode") # Using mode or no method call results in the
```

Truncated SVD while limiting LD.

```r
newpc<-snp_autoSVD(G_missSimple,infos.chr =chrom_sort,infos.pos = pos_sort)
```

```
##
## Phase of clumping (on MAF) at r^2 > 0.2.. keep 18348 SNPs.
## Discarding 5815 variants with MAC < 10.
##
## Iteration 1:
## Computing SVD..
## 0 outlier variant detected..
##
## Converged!
```

```r
which_pruned <- attr(newpc, which="subset") # Indexes of remaining SNPS after pruning
length(which_pruned)
```

```
## [1] 12533
```

Either removing missing data or imputation results in a similar number of trimmed SNPs, so I will continue forward with missing data removed.

```r
invisible(lapply(which_pruned_miss, write, "pruned_data.txt", append=TRUE))
```

In terminal

```
$ mawk '!/#/' neutralloci.recode.vcf | cut -f1,2 > totalloci

```

Estimating effective migration surfaces (EEMS)

The program `runeems_snps` implements the EEMS method for analyzing spatial population structure. This version uses the pairwise genetic dissimilarity matrix computed from SNP data.

Here is the code used to run `runeems_snps` in both RStudio and command-line. Detailed steps for running this program can be accessed here. Input files are created in RStudio or manually (see below) and saved to the directory where `runeems_snps` will be run. The program is then run in the command-line. The outputs are then plotted in RStudio.

`runeems_snps` requires three data input files that have the same file name but different extension. The description below assumes that datapath is the full path + the file name (but without the extension).

1. datapath.diffs

`datapath.diffs` is the matrix of average pairwise genetic dissimilarities. This can be computed with bed2diffs from genetic data in plink binary format.

The dissimilarity matrix is nonnegative, symmetric, with 0s on the main diagonal. These conditions are necessary but not sufficient for diffs to be a valid dissimilarity matrix. Mathematically, diffs should be conditionally negative definite.

Steps for generating `datapath.diffs` are completed in RStudio.

```
# V1 methtod to get diffs matrix, preferred
bed2diffs_v1 <- function(Geno) {
  nIndiv <- nrow(Geno)
  nSites <- ncol(Geno)
  Diffs <- matrix(0, nIndiv, nIndiv)

  for (i in seq(nIndiv - 1)) {
    for (j in seq(i + 1, nIndiv)) {
      x <- Geno[i, ]
      y <- Geno[j, ]
      Diffs[i, j] <- mean((x - y)^2, na.rm = TRUE)
      Diffs[j, i] <- Diffs[i, j]
    }
  }
  Diffs
}
```

```r
# V2 method to get .diffs matrix, only if V1 doesn't work
bed2diffs_v2 <- function(Geno) {
  nIndiv <- nrow(Geno)
  nSites <- ncol(Geno)
  Miss <- is.na(Geno)
  ## Impute NAs with the column means (= twice the allele frequencies)
  Mean <- matrix(colMeans(Geno, na.rm = TRUE), ## a row of means
                 nrow = nIndiv, ncol = nSites, byrow = TRUE) ## a matrix with nIndiv identical rows of m
  Mean[Miss == 0] <- 0 ## Set the means that correspond to observed genotypes to 0
  Geno[Miss == 1] <- 0 ## Set the missing genotypes to 0 (used to be NA)
  Geno <- Geno + Mean
  ## Compute similarities
  Sim <- Geno %*% t(Geno) / nSites
  SelfSim <- diag(Sim) ## self-similarities
  vector1s <- rep(1, nIndiv) ## vector of 1s
  ## This chunk generates a `diffs` matrix
  Diffs <- SelfSim %*% t(vector1s) + vector1s %*% t(SelfSim) - 2 * Sim
  Diffs
}
```

```r
geno <- stratted.filt@tab
```

```r
# Get rid of non-biallelic loci
multi.loci <- names(which(stratted.filt@loc.n.all != 2))
multi.cols <- which(grepl(paste0("^", multi.loci, "\\.\\d+$", collapse = "|"), colnames(geno)))
if (length(multi.cols)) geno <- geno[, - multi.cols]
nloci <- dim(geno)[2] / 2
dim(geno)
```

```
## [1]     40 148548
```

```r
stopifnot(identical(stratted.filt@type, 'codom'))
```

```r
# bed2diffs functions
diffs.v1 <- bed2diffs_v1(geno)
diffs.v2 <- bed2diffs_v2(geno)
# Round to 6 digits
diffs.v1 <- round(diffs.v1, digits = 6)
diffs.v2 <- round(diffs.v2, digits = 6)
```

Check that the dissimilarity matrix has one positive eigenvalue and nIndiv-1 negative eigenvalues, as required by a full-rank Euclidean distance matrix. If the V1 method does not make a Euclidean matrix, you must use V2.

```r
tail(sort(round(eigen(diffs.v1)$values, digits = 2)))
```

```
## [1] -0.49 -0.48 -0.48 -0.48 -0.47 21.06
```

```r
tail(sort(round(eigen(diffs.v2)$values, digits = 2)))
```

```
## [1] -0.48 -0.48 -0.47 -0.47 -0.46 20.73
```

```r
# Set suffix for EEMS input files
suf <- "neutraldata-filt"
```

```r
# This saves the file to directory
write.table(diffs.v1, paste(suf,".v1.diffs",sep=""),
            col.names = FALSE, row.names = FALSE, quote = FALSE)
```

2. datapath.coord

`datapath.coord` are the sample coordinates, two coordinates per sample, one sample per line. The sampling locations should be given in the same order as the rows and columns of the dissimilarity matrix.

Steps for generating `datapath.coord` are completed in RStudio.

```
## Get gps coordinates from previously created info matrix
xOR.info <- dplyr::filter(info)
gps_matrix <- select(xOR.info,c("Longitude","Latitude"))
```

```
#write .coord file
write.table(gps_matrix, paste(suf,".v1.coord",sep=""),col.names = FALSE, row.names = FALSE,quote = FALSE
```

3. datapath.outer

`datapath.outer` are the habitat coordinates, as a sequence of vertices that form a closed polygon. The habitat vertices should be listed counterclockwise and the first vertex should also be the last vertex, so that the outline is a closed ring. Otherwise, EEMS attempts to "correct" the polygon and prints a warning message.

`datapath.outer` is created manually in Excel,based on site coordinates gathered from Google Maps, copied into terminal using `nano`, and saved as the file with the appropriate extension.

**`runeems_snps` is then run in command-line following the steps documented in NB_EEMS_OutlierHap.md

Back in RStudio to plot `runeems_snps` outputs

```
# Install rEEMSplots
library(rEEMSplots)
```

```
# Plotting EEMS after running runeems_snps
path = "./NB_EEMS_Neutral/"
dirs = c(paste0(path,"neutraldata-D200-chain1"), paste0(path,"neutraldata-D300-chain1"), paste0(path,"ne
```

```
eems.plots(mcmcpath = c(paste0(path,"./neutraldata-D200-chain1"), paste0(path,"neutraldata-D300-chain1")
           longlat = T,add.grid=F,add.outline = T,add.demes = T,
           projection.in = "+proj=longlat +datum=WGS84",projection.out = "+proj=merc +datum=WGS84",
           add.map = T,add.abline = T, add.r.squared = T)
```

```

Neutral Genic SNPs

Making files

Make genind object

`neutralgene.recode.vcf` contains neutral SNPs from genic regions for populations PVD, GB, BIS, and NAR. Steps for generating this VCF file are located in EecSeq_Cvirginica_NeutralLoci.md.

Population NIN was removed from the VCF file following steps in EecSeq_Cvirginica_OutlierDetection.md.

`strata` contains population, environmental, and library information for each sample - can be accessed here.

```
my_vcf_gene <- read.vcfR("neutralgene.recode.vcf")
```

```

```

Repeat for quasi-independent set of SNPs

Steps for filtering are documented for OutFLANK in EecSeq_Cvirginica_OutlierDetection.md. However, I am repeating the steps here.

```
my_vcf_gene <- read.vcfR("neutralgene.recode.vcf")
```

```

```
geno_gene <- extract.gt(my_vcf_gene) # Character matrix containing the genotypes
position_gene <- getPOS(my_vcf_gene) # Positions in bp
chromosome_gene <- getCHROM(my_vcf_gene) # Chromosome information

G_gene <- matrix(NA, nrow = nrow(geno_gene), ncol = ncol(geno_gene))

G_gene[geno_gene %in% c("0/0", "0|0")] <- 0
G_gene[geno_gene  %in% c("0/1", "1/0", "1|0", "0|1")] <- 1
G_gene[geno_gene %in% c("1/1", "1|1")] <- 2

# NA should be replaced with "9"
G_gene[is.na(G_gene)] <- 9
```

Chromosomes need to be of class integer for this to work.

```
# Visualizing chromosomes
chrom_unique_gene <- unique(chromosome_gene)
print(chrom_unique_gene)
```

```
##  [1] "NC_035780.1" "NC_035781.1" "NC_035782.1" "NC_035783.1" "NC_035784.1"
##  [6] "NC_035785.1" "NC_035786.1" "NC_035787.1" "NC_035788.1" "NC_035789.1"
```

```
# Removing "NC_" from the chromosome name so it can be converted to an integer
chrom_new_gene <- chromosome_gene%>%str_replace("NC_","")

# Converting the character string into an integer
chrom1_gene <- as.integer(chrom_new_gene)
```

`chromosome` and `position` need to be sorted for imputation to work.

```
chrom_sort_gene <- sort(chrom1_gene)
pos_sort_gene <- sort(position_gene)
```

Note: This filtering program does not allow for missing genotype values.

Remove missing genotypes

```
# removing missing data
G_gene_miss <- matrix(NA, nrow = nrow(geno_gene), ncol = ncol(geno_gene))

G_gene_miss[geno_gene %in% c("0/0", "0|0")] <- 0
G_gene_miss[geno_gene  %in% c("0/1", "1/0", "1|0", "0|1")] <- 1
G_gene_miss[geno_gene %in% c("1/1", "1|1")] <- 2

# removing missing data
G_gene_miss[na.omit(G_gene_miss)]
```

```

```

Estimating effective migration surfaces (EEMS)

1. datapath.diffs

Steps for generating `datapath.diffs` are completed in RStudio.

```
# V1 methtod to get diffs matrix, preferred
bed2diffs_v1 <- function(Geno) {
  nIndiv <- nrow(Geno)
  nSites <- ncol(Geno)
  Diffs <- matrix(0, nIndiv, nIndiv)

  for (i in seq(nIndiv - 1)) {
    for (j in seq(i + 1, nIndiv)) {
      x <- Geno[i, ]
      y <- Geno[j, ]
      Diffs[i, j] <- mean((x - y)^2, na.rm = TRUE)
      Diffs[j, i] <- Diffs[i, j]
    }
  }
  Diffs
}
```

```
# V2 method to get .diffs matrix, only if V1 doesn't work
bed2diffs_v2 <- function(Geno) {
  nIndiv <- nrow(Geno)
  nSites <- ncol(Geno)
  Miss <- is.na(Geno)
  ## Impute NAs with the column means (= twice the allele frequencies)
  Mean <- matrix(colMeans(Geno, na.rm = TRUE), ## a row of means
                 nrow = nIndiv, ncol = nSites, byrow = TRUE) ## a matrix with nIndiv identical rows of m
  Mean[Miss == 0] <- 0 ## Set the means that correspond to observed genotypes to 0
  Geno[Miss == 1] <- 0 ## Set the missing genotypes to 0 (used to be NA)
  Geno <- Geno + Mean
  ## Compute similarities
  Sim <- Geno %*% t(Geno) / nSites
  SelfSim <- diag(Sim) ## self-similarities
  vector1s <- rep(1, nIndiv) ## vector of 1s
  ## This chunk generates a `diffs` matrix
  Diffs <- SelfSim %*% t(vector1s) + vector1s %*% t(SelfSim) - 2 * Sim
  Diffs
}
```

```
geno_gene <- stratted.filt_gene@tab
```

```
# Get rid of non-biallelic loci
multi.loci_gene <- names(which(stratted.filt_gene@loc.n.all != 2))
multi.cols_gene <- which(grepl(paste0("^", multi.loci_gene, "\\.\\d+$", collapse = "|"), colnames(geno_g
if (length(multi.cols_gene)) geno_gene <- geno_gene[, - multi.cols_gene]
nloci_gene <- dim(geno_gene)[2] / 2
dim(geno_gene)
```

```
## [1]     40 133430
```

```
stopifnot(identical(stratted.filt_gene@type, 'codom'))
```

```r
# bed2diffs functions
diffs.v1_gene <- bed2diffs_v1(geno_gene)
diffs.v2_gene <- bed2diffs_v2(geno_gene)
# Round to 6 digits
diffs.v1_gene <- round(diffs.v1_gene, digits = 6)
diffs.v2_gene <- round(diffs.v2_gene, digits = 6)
```

Check that the dissimilarity matrix has one positive eigenvalue and nIndiv-1 negative eigenvalues, as required by a full-rank Euclidean distance matrix. If the V1 method does not make a Euclidean matrix, you must use V2.

```r
tail(sort(round(eigen(diffs.v1_gene)$values, digits = 2)))
```

```
## [1] -0.49 -0.49 -0.48 -0.48 -0.48 21.15
```

```r
tail(sort(round(eigen(diffs.v2_gene)$values, digits = 2)))
```

```
## [1] -0.48 -0.48 -0.47 -0.47 -0.46 20.83
```

```r
# Set suffix for EEMS input files
suf_gene <- "neutralexondata-filt"
```

```r
# This saves the file to directory
write.table(diffs.v1_gene, paste(suf_gene,".v1.diffs",sep=""),
            col.names = FALSE, row.names = FALSE, quote = FALSE)
```

2. datapath.coord

`datapath.coord` are the sample coordinates, two coordinates per sample, one sample per line. The sampling locations should be given in the same order as the rows and columns of the dissimilarity matrix.

Steps for generating `datapath.coord` are completed in RStudio.

```r
## Get gps coordinates from previously created info matrix
xOR.info <- dplyr::filter(info)
gps_matrix <- select(xOR.info,c("Longitude","Latitude"))
```

```r
#write .coord file
write.table(gps_matrix, paste(suf_gene,".v1.coord",sep=""),col.names = FALSE, row.names = FALSE,quote =
```

3. datapath.outer

`datapath.outer` are the habitat coordinates, as a sequence of vertices that form a closed polygon. The habitat vertices should be listed counterclockwise and the first vertex should also be the last vertex, so that the outline is a closed ring. Otherwise, EEMS attempts to "correct" the polygon and prints a warning message.

`datapath.outer` is created manually in Excel,based on site coordinates gathered from Google Maps, copied into terminal using `nano`, and saved as the file with the appropriate extension.

**`runeems_snps` is then run in command-line following the steps documented in NB_EEMS_OutlierHap.md

Back in RStudio to plot `runeems_snps` outputs

```r
# Install rEEMSplots
library(rEEMSplots)
```

```r
# Plotting EEMS after running runeems_snps
path = "./NB_EEMS_Neutral/"
dirs = c(paste0(path,"neutralgenedata-D200-chain1"), paste0(path,"neutralgenedata-D300-chain1"), paste0
```

```r
eems.plots(mcmcpath = c(paste0(path,"./neutralgenedata-D200-chain1"), paste0(path,"neutralgenedata-D300-
           longlat = T,add.grid=F,add.outline = T,add.demes = T,
           projection.in = "+proj=longlat +datum=WGS84",projection.out = "+proj=merc +datum=WGS84",
           add.map = T,add.abline = T, add.r.squared = T)
```

```
## Input projection: +proj=longlat +datum=WGS84

Neutral Intergenic SNPs

Making files

Make genind object

`neutralintergenic.recode.vcf` contains neutral SNPs from intergenic regions for populations PVD, GB, BIS, and NAR. Steps for generating this VCF file are located in EecSeq_Cvirginica_NeutralLoci.md.

Population NIN was removed from the VCF file following steps in EecSeq_Cvirginica_OutlierDetection.md.

`strata` contains population, environmental, and library information for each sample - can be accessed here.

```
my_vcf_inter <- read.vcfR("neutralintergenic.recode.vcf")
```

```

## All variants processed
```

```
geno_inter <- extract.gt(my_vcf_inter) # Character matrix containing the genotypes
position_inter <- getPOS(my_vcf_inter) # Positions in bp
chromosome_inter <- getCHROM(my_vcf_inter) # Chromosome information

G_inter <- matrix(NA, nrow = nrow(geno_inter), ncol = ncol(geno_inter))

G_inter[geno_inter %in% c("0/0", "0|0")] <- 0
G_inter[geno_inter  %in% c("0/1", "1/0", "1|0", "0|1")] <- 1
G_inter[geno_inter %in% c("1/1", "1|1")] <- 2

# NA should be replaced with "9"
G_inter[is.na(G_inter)] <- 9
```

Chromosomes need to be of class integer for this to work.

```
# Visualizing chromosomes
chrom_unique_inter <- unique(chromosome_inter)
print(chrom_unique_inter)
```

```
##  [1] "NC_035780.1" "NC_035781.1" "NC_035782.1" "NC_035783.1" "NC_035784.1"
##  [6] "NC_035785.1" "NC_035786.1" "NC_035787.1" "NC_035788.1" "NC_035789.1"
```

```
# Removing "NC_" from the chromosome name so it can be converted to an integer
chrom_new_inter <- chromosome_inter%>%str_replace("NC_","")

# Converting the character string into an integer
chrom1_inter <- as.integer(chrom_new_inter)
```

`chromosome` and `position` need to be sorted for imputation to work.

```
chrom_sort_inter <- sort(chrom1_inter)
pos_sort_inter <- sort(position_inter)
```

Note: This filtering program does not allow for missing genotype values.

Remove missing genotypes

```r
# removing missing data
G_inter_miss <- matrix(NA, nrow = nrow(geno_inter), ncol = ncol(geno_inter))

G_inter_miss[geno_inter %in% c("0/0", "0|0")] <- 0
G_inter_miss[geno_inter  %in% c("0/1", "1/0", "1|0", "0|1")] <- 1
G_inter_miss[geno_inter %in% c("1/1", "1|1")] <- 2

# removing missing data
G_inter_miss[na.omit(G_inter_miss)]
```

```

Estimating effective migration surfaces (EEMS)

1. datapath.diffs

Steps for generating `datapath.diffs` are completed in RStudio.

```
# V1 methtod to get diffs matrix, preferred
bed2diffs_v1 <- function(Geno) {
  nIndiv <- nrow(Geno)
  nSites <- ncol(Geno)
  Diffs <- matrix(0, nIndiv, nIndiv)

  for (i in seq(nIndiv - 1)) {
    for (j in seq(i + 1, nIndiv)) {
      x <- Geno[i, ]
      y <- Geno[j, ]
      Diffs[i, j] <- mean((x - y)^2, na.rm = TRUE)
      Diffs[j, i] <- Diffs[i, j]
    }
  }
  Diffs
}
```

```
# V2 method to get .diffs matrix, only if V1 doesn't work
bed2diffs_v2 <- function(Geno) {
  nIndiv <- nrow(Geno)
  nSites <- ncol(Geno)
  Miss <- is.na(Geno)
  ## Impute NAs with the column means (= twice the allele frequencies)
  Mean <- matrix(colMeans(Geno, na.rm = TRUE), ## a row of means
                 nrow = nIndiv, ncol = nSites, byrow = TRUE) ## a matrix with nIndiv identical rows of m
  Mean[Miss == 0] <- 0 ## Set the means that correspond to observed genotypes to 0
  Geno[Miss == 1] <- 0 ## Set the missing genotypes to 0 (used to be NA)
  Geno <- Geno + Mean
  ## Compute similarities
  Sim <- Geno %*% t(Geno) / nSites
  SelfSim <- diag(Sim) ## self-similarities
  vector1s <- rep(1, nIndiv) ## vector of 1s
  ## This chunk generates a `diffs` matrix
  Diffs <- SelfSim %*% t(vector1s) + vector1s %*% t(SelfSim) - 2 * Sim
  Diffs
}
```

```
geno_inter <- stratted.filt_inter@tab
```

```
# Get rid of non-biallelic loci
multi.loci_inter <- names(which(stratted.filt_inter@loc.n.all != 2))
multi.cols_inter <- which(grepl(paste0("^", multi.loci_inter, "\\.\\d+$", collapse = "|"), colnames(geno
if (length(multi.cols_inter)) geno_inter <- geno_inter[, - multi.cols_inter]
nloci_inter <- dim(geno_inter)[2] / 2
dim(geno_inter)
```

```
## [1]    40 15118
```

```
stopifnot(identical(stratted.filt_inter@type, 'codom'))
```

```r
# bed2diffs functions
diffs.v1_inter <- bed2diffs_v1(geno_inter)
diffs.v2_inter <- bed2diffs_v2(geno_inter)
# Round to 6 digits
diffs.v1_inter <- round(diffs.v1_inter, digits = 6)
diffs.v2_inter <- round(diffs.v2_inter, digits = 6)
```

Check that the dissimilarity matrix has one positive eigenvalue and nIndiv-1 negative eigenvalues, as required by a full-rank Euclidean distance matrix. If the V1 method does not make a Euclidean matrix, you must use V2.

```r
tail(sort(round(eigen(diffs.v1_inter)$values, digits = 2)))
```

```
## [1] -0.40 -0.40 -0.39 -0.38 -0.37 20.20
```

```r
tail(sort(round(eigen(diffs.v2_inter)$values, digits = 2)))
```

```
## [1] -0.40 -0.39 -0.39 -0.38 -0.37 19.83
```

```r
# Set suffix for EEMS input files
suf_inter <- "neutralinterdata-filt"
```

```r
# This saves the file to directory
write.table(diffs.v1_inter, paste(suf_inter,".v1.diffs",sep=""),
            col.names = FALSE, row.names = FALSE, quote = FALSE)
```

2. datapath.coord

`datapath.coord` are the sample coordinates, two coordinates per sample, one sample per line. The sampling locations should be given in the same order as the rows and columns of the dissimilarity matrix.

Steps for generating `datapath.coord` are completed in RStudio.

```r
## Get gps coordinates from previously created info matrix
xOR.info <- dplyr::filter(info)
gps_matrix <- select(xOR.info,c("Longitude","Latitude"))
```

```r
#write .coord file
write.table(gps_matrix, paste(suf_inter,".v1.coord",sep=""),col.names = FALSE, row.names = FALSE,quote =
```

3. datapath.outer

`datapath.outer` are the habitat coordinates, as a sequence of vertices that form a closed polygon. The habitat vertices should be listed counterclockwise and the first vertex should also be the last vertex, so that the outline is a closed ring. Otherwise, EEMS attempts to "correct" the polygon and prints a warning message.

`datapath.outer` is created manually in Excel,based on site coordinates gathered from Google Maps, copied into terminal using `nano`, and saved as the file with the appropriate extension.

**`runeems_snps` is then run in command-line following the steps documented in NB_EEMS_OutlierHap.md

Back in RStudio to plot `runeems_snps` outputs

```r
# Install rEEMSplots
library(rEEMSplots)
```

```r
# Plotting EEMS after running runeems_snps
path = "./NB_EEMS_Neutral/"
dirs = c(paste0(path,"neutralinterdata-D200-chain1"), paste0(path,"neutralinterdata-D300-chain1"), paste
```

```r
eems.plots(mcmcpath = c(paste0(path,"./neutralinterdata-D200-chain1"), paste0(path,"neutralinterdata-D3
           longlat = T,add.grid=F,add.outline = T,add.demes = T,
           projection.in = "+proj=longlat +datum=WGS84",projection.out = "+proj=merc +datum=WGS84",
           add.map = T,add.abline = T, add.r.squared = T)
```

```
## Input projection: +proj=longlat +datum=WGS84
## Output projection: +proj=merc +datum=WGS84

Neutral Intron SNPs

Making files

Make genind object

`neutralintron.recode.vcf` contains neutral SNPs from intron regions for populations PVD, GB, BIS, and NAR. Steps for generating this VCF file are located in EecSeq_Cvirginica_NeutralLoci.md.

Population NIN was removed from the VCF file following steps in EecSeq_Cvirginica_OutlierDetection.md.

`strata` contains population, environmental, and library information for each sample - can be accessed here.

```
my_vcf_intron <- read.vcfR("neutralintron.recode.vcf")
```

##    @loc.n.all: number of alleles per locus (range: 1-2)
##    @loc.fac: locus factor for the 33351 columns of @tab
##    @all.names: list of allele names for each locus
##    @ploidy: ploidy of each individual  (range: 2-2)
##    @type:  codom
##    @call: adegenet::df2genind(X = t(x), sep = sep, pop = ..2, strata = ..1)
##
##  // Optional content
##    @pop: population of each individual (group size range: 10-10)
##    @strata: a data frame with 1 columns ( Population )
##    @other: a list containing: Latitude  Longitude  Distance  SE  Temperature  Salinity  pH  Chlorophy
```

Repeat for quasi-independent set of SNPs

Steps for filtering are documented for OutFLANK in EecSeq_Cvirginica_OutlierDetection.md. However, I

am repeating the steps here.

```
my_vcf_intron <- read.vcfR("neutralintron.recode.vcf")
```

```

```

```
geno_intron <- extract.gt(my_vcf_intron) # Character matrix containing the genotypes
position_intron <- getPOS(my_vcf_intron) # Positions in bp
chromosome_intron <- getCHROM(my_vcf_intron) # Chromosome information

G_intron <- matrix(NA, nrow = nrow(geno_intron), ncol = ncol(geno_intron))

G_intron[geno_intron %in% c("0/0", "0|0")] <- 0
G_intron[geno_intron  %in% c("0/1", "1/0", "1|0", "0|1")] <- 1
G_intron[geno_intron %in% c("1/1", "1|1")] <- 2

# NA should be replaced with "9"
G_intron[is.na(G_intron)] <- 9
```

Chromosomes need to be of class integer for this to work.

```r
# Visualizing chromosomes
chrom_unique_intron <- unique(chromosome_intron)
print(chrom_unique_intron)
```

```
##  [1] "NC_035780.1" "NC_035781.1" "NC_035782.1" "NC_035783.1" "NC_035784.1"
##  [6] "NC_035785.1" "NC_035786.1" "NC_035787.1" "NC_035788.1" "NC_035789.1"
```

```r
# Removing "NC_" from the chromosome name so it can be converted to an integer
chrom_new_intron <- chromosome_intron%>%str_replace("NC_","")

# Converting the character string into an integer
chrom1_intron <- as.integer(chrom_new_intron)
```

`chromosome` and `position` need to be sorted for imputation to work.

```r
chrom_sort_intron <- sort(chrom1_intron)
pos_sort_intron <- sort(position_intron)
```

Note: This filtering program does not allow for missing genotype values.

Remove missing genotypes

```r
# removing missing data
G_intron_miss <- matrix(NA, nrow = nrow(geno_intron), ncol = ncol(geno_intron))

G_intron_miss[geno_intron %in% c("0/0", "0|0")] <- 0
G_intron_miss[geno_intron  %in% c("0/1", "1/0", "1|0", "0|1")] <- 1
G_intron_miss[geno_intron %in% c("1/1", "1|1")] <- 2

# removing missing data
G_intron_miss[na.omit(G_intron_miss)]
```

```

##    @other: a list containing: Latitude  Longitude  Distance  SE  Temperature  Salinity  pH  Chlorophy
```

Make hierfstat object

```
hf.filt_intron <- genind2hierfstat(rad.filt_intron, pop = c(rep("BIS", 10),rep("GB", 10),rep("NAR", 10)
```

```
hf.u_intron <- genind2hierfstat(rad.u_intron, pop = c(rep("BIS", 10),rep("GB", 10),rep("NAR", 10), rep(
hf.u_intron <- hf.u_intron$hierfstat.no.imputation
```

Estimating effective migration surfaces (EEMS)

1. datapath.diffs

Steps for generating `datapath.diffs` are completed in RStudio.

```
# V1 methtod to get diffs matrix, preferred
bed2diffs_v1 <- function(Geno) {
  nIndiv <- nrow(Geno)
  nSites <- ncol(Geno)
  Diffs <- matrix(0, nIndiv, nIndiv)

  for (i in seq(nIndiv - 1)) {
    for (j in seq(i + 1, nIndiv)) {
      x <- Geno[i, ]
      y <- Geno[j, ]
      Diffs[i, j] <- mean((x - y)^2, na.rm = TRUE)
      Diffs[j, i] <- Diffs[i, j]
    }
  }
  Diffs
}
```

```
# V2 method to get .diffs matrix, only if V1 doesn't work
bed2diffs_v2 <- function(Geno) {
  nIndiv <- nrow(Geno)
  nSites <- ncol(Geno)
  Miss <- is.na(Geno)
  ## Impute NAs with the column means (= twice the allele frequencies)
  Mean <- matrix(colMeans(Geno, na.rm = TRUE), ## a row of means
                 nrow = nIndiv, ncol = nSites, byrow = TRUE) ## a matrix with nIndiv identical rows of m
```

```
  Mean[Miss == 0] <- 0 ## Set the means that correspond to observed genotypes to 0
  Geno[Miss == 1] <- 0 ## Set the missing genotypes to 0 (used to be NA)
  Geno <- Geno + Mean
  ## Compute similarities
  Sim <- Geno %*% t(Geno) / nSites
  SelfSim <- diag(Sim) ## self-similarities
  vector1s <- rep(1, nIndiv) ## vector of 1s
  ## This chunk generates a `diffs` matrix
  Diffs <- SelfSim %*% t(vector1s) + vector1s %*% t(SelfSim) - 2 * Sim
  Diffs
}
```

```
geno_intron <- stratted.filt_intron@tab
```

```
# Get rid of non-biallelic loci
multi.loci_intron <- names(which(stratted.filt_intron@loc.n.all != 2))
multi.cols_intron <- which(grepl(paste0("^", multi.loci_intron, "\\.\\d+$", collapse = "|"), colnames(g
if (length(multi.cols_intron)) geno_intron <- geno_intron[, - multi.cols_intron]
nloci_intron <- dim(geno_intron)[2] / 2
dim(geno_intron)
```

```
## [1]    40 33300
```

```
stopifnot(identical(stratted.filt_intron@type, 'codom'))
```

```
# bed2diffs functions
diffs.v1_intron <- bed2diffs_v1(geno_intron)
diffs.v2_intron <- bed2diffs_v2(geno_intron)
# Round to 6 digits
diffs.v1_intron <- round(diffs.v1_intron, digits = 6)
diffs.v2_intron <- round(diffs.v2_intron, digits = 6)
```

Check that the dissimilarity matrix has one positive eigenvalue and nIndiv-1 negative eigenvalues, as required by a full-rank Euclidean distance matrix. If the V1 method does not make a Euclidean matrix, you must use V2.

```
tail(sort(round(eigen(diffs.v1_intron)$values, digits = 2)))
```

```
## [1] -0.46 -0.45 -0.44 -0.44 -0.43 21.23
```

```
tail(sort(round(eigen(diffs.v2_intron)$values, digits = 2)))
```

```
## [1] -0.45 -0.44 -0.43 -0.43 -0.43 20.88
```

```
# Set suffix for EEMS input files
suf_intron <- "neutralintrondata-filt"
```

```
# This saves the file to directory
write.table(diffs.v1_intron, paste(suf_intron,".v1.diffs",sep=""),
            col.names = FALSE, row.names = FALSE, quote = FALSE)
```

2. datapath.coord

`datapath.coord` are the sample coordinates, two coordinates per sample, one sample per line. The sampling locations should be given in the same order as the rows and columns of the dissimilarity matrix.

Steps for generating `datapath.coord` are completed in RStudio.

```
## Get gps coordinates from previously created info matrix
xOR.info <- dplyr::filter(info)
gps_matrix <- select(xOR.info,c("Longitude","Latitude"))
```

```
#write .coord file
write.table(gps_matrix, paste(suf_intron,".v1.coord",sep=""),col.names = FALSE, row.names = FALSE,quote
```

3. datapath.outer

`datapath.outer` are the habitat coordinates, as a sequence of vertices that form a closed polygon. The habitat vertices should be listed counterclockwise and the first vertex should also be the last vertex, so that the outline is a closed ring. Otherwise, EEMS attempts to "correct" the polygon and prints a warning message.

`datapath.outer` is created manually in Excel,based on site coordinates gathered from Google Maps, copied into terminal using `nano`, and saved as the file with the appropriate extension.

**`runeems_snps` is then run in command-line following the steps documented in NB_EEMS_OutlierHap.md

Back in RStudio to plot `runeems_snps` outputs

```
# Install rEEMSplots
library(rEEMSplots)
```

```
# Plotting EEMS after running runeems_snps
path = "./NB_EEMS_Neutral/"
dirs = c(paste0(path,"neutralintrondata-D200-chain1"), paste0(path,"neutralintrondata-D300-chain1"), pa
```

```
eems.plots(mcmcpath = c(paste0(path,"./neutralintrondata-D200-chain1"), paste0(path,"neutralintrondata-
           longlat = T,add.grid=F,add.outline = T,add.demes = T,
           projection.in = "+proj=longlat +datum=WGS84",projection.out = "+proj=merc +datum=WGS84",
           add.map = T,add.abline = T, add.r.squared = T)
```

```

```

Seascape Redundancy Analysis

This code follows that documented by Tom Jenkins.

Prepare genetic data for redundancy analysis.

Notes before execution:

1. Make sure all required R packages are installed.
2. Set working directory to the location of this R script.

```r
# Load packages
library(adegenet)
library(poppr)
```

```
## Registered S3 method overwritten by 'pegas':
##   method      from
##   print.amova ade4
```

```
## This is poppr version 2.8.5. To get started, type package?poppr
## OMP parallel support: available
```

```
##
## Attaching package: 'poppr'
```

```
## The following object is masked from 'package:radiator':
##
##     private_alleles
```

```r
library(dplyr)
library(reshape2)
library(ggplot2)
library(vcfR)
```

```r
# Explore data
rad.filt
```

```
## /// GENIND OBJECT /////////
##
##  // 40 individuals; 74,520 loci; 148,794 alleles; size: 67.9 Mb
##
##  // Basic content
##    @tab:  40 x 148794 matrix of allele counts
##    @loc.n.all: number of alleles per locus (range: 1-2)
##    @loc.fac: locus factor for the 148794 columns of @tab
##    @all.names: list of allele names for each locus
##    @ploidy: ploidy of each individual  (range: 2-2)
##    @type:  codom
##    @call: adegenet::df2genind(X = t(x), sep = sep, pop = ..2, strata = ..1)
##
##  // Optional content
##    @pop: population of each individual (group size range: 8-8)
##    @strata: a data frame with 12 columns ( Individual, Population, Latitude, Longitude, Distance, SE
```

```r
nLoc(rad.filt) # number of loci
```

```
## [1] 74520
```

```r
nPop(rad.filt) # number of sites
```

```
## [1] 5
```

```r
nInd(rad.filt) # number of individuals
```

```
## [1] 40
```

```r
summary(rad.filt$pop) # sample size
```

```
## 1 5 2 3 4
## 8 8 8 8 8
```

```r
# Calculate allele frequencies for each site
allele_freqs = data.frame(rraf(rad.filt, by_pop = TRUE, correction = FALSE), check.names = FALSE)
```

```r
# Keep only the first of the two alleles for each SNP (since p=1-q).
allele_freqs = allele_freqs[, seq(1, dim(allele_freqs)[2], 2)]
```

```r
# Export allele frequencies
write.csv(allele_freqs, file = "all_allele_freqs.csv", row.names = TRUE)
```

Calculate minor allele frequencies

```r
# Separate genind object by site
site_list = seppop(rad.filt)
names(site_list)
```

```
## [1] "1" "5" "2" "3" "4"
```

```r
# Calculate the minor allele frequency for each site
maf_list = lapply(site_list, FUN = minorAllele)
```

```r
# Convert list to dataframe
maf = as.data.frame(maf_list) %>% t() %>% as.data.frame()
```

```r
# Export minor allele frequencies
write.csv(maf, file = "minor_allele_freqs.csv", row.names = TRUE)
```

Prepare environmental data for redundancy analysis.

Environmental variables:

- Distance from sewage effluent source (km)

- Sewage Effluent (PW stats)
- Mean temperature (deg C)
- Mean Salinity (psu)
- Mean pH
- Mean Chlorophyll-a (ug/L)
- Mean Dissolved Oxygen (mg/L)

Environmental data for each population is saved in a `strata_pop` file that can be accessed here

```
# All environmental data was previously saved in strata file
strata_pop <- read.table("strata_pop", header=TRUE)
strata_pop
```

```
##   Population Latitude Longitude Distance     SE Temperature Salinity  pH
## 1        BIS   41.545   -71.431     4.76  8.825          23       30 7.9
## 2         GB   41.654   -71.445     0.47 14.596          24       28 7.4
## 3        NAR   41.505   -71.453    15.41  2.027          25       18 7.6
## 4        PVD   41.816   -71.391     1.49 59.860          23       25 7.4
##   Chlorophylla  DO
## 1          4.9 8.2
## 2         18.8 5.7
## 3          4.6 7.0
## 4          8.1 4.9
```

```
# Export data as a csv file
write.csv(strata_pop, file="environmental_data.csv", row.names = FALSE)
```

I also prepared spatial data for the redundancy analysis which is documented here.

Allele frequency, environmental, and spatial csv files are saved to your working directory and must be imported into the Rscript to run the redundancy analysis. Documentation of the RDA can be accessed here.

RDA and pRDA output plots can be viewed here.
